# SUBJECT No. 1 <br> Time allowed: 2 hours; All materials/equipments authorized 

Instructor: conf. Radu Damian Student: $\qquad$ Grupa $\qquad$

Note. Except where otherwise specified, assume $50 \Omega$ reference impedance.
Note. Any CAD solution (Matlab, Mathcad, ADS) must be accompanied by the submission of the script/project at the end of the examination.

1. For a normalized impedance equal to $0.735+\mathrm{j} \cdot 1.035$ compute the admittance ( $\mathbf{1 p}$ ) and then plot on a Smith Chart (external circle and complex plane axes) the corresponding point (1p)
2. A circuit contains an ideal lossless coupler (matched on all ports with infinite isolation) with a coupling factor $\mathrm{C}=4.25 \mathrm{~dB}$ and two matched amplifiers $\mathrm{G}_{1}=9.3 \mathrm{~dB}$ and $\mathrm{G}_{2}=11.1 \mathrm{~dB}$. If the input power is 1.65 mW compute the output power (in mW) (2p)

3. A $50 \Omega$ source is connected to an unknown load resulting an reflection coefficient (as seen by the source) $\Gamma=-0.323+\mathrm{j} \cdot 0.314$.
a) Compute the impedance of the unknown load. (1p)
b) Compute the reflection coefficient seen by the source if we connect to the $50 \Omega$ source two devices identical to the unknown load determined at a) in parallel. (1p)
c) For b) design the match with single-stub matching sections (shunt stub, both solutions). (1.5p)
d) Draw the match schematic. (0.5p)
4. In order to obtain an 15.90 dB gain (minimum) amplifier you must cascade two devices (amplifiers). You have available the four devices in the following table.

| Device | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ |
| :---: | :---: | :---: | :---: | :---: |
| Gain $[\mathrm{dB}]$ | 8.3 | 11.6 | 6.5 | 8.0 |
| Noise Factor $[\mathrm{dB}]$ | 0.92 | 1.23 | 0.50 | 0.85 |

a) Specify any two devices you can use to meet the amplifier requirements. (0.5p)
b) Of all the combinations that meet the requirements, which one has the minimum noise factor? Explain your choice. (1.5p)
5. The scattering parameters of a transistor at two frequencies are as follows:

| $\mathrm{f}[\mathrm{GHz}]$ | $\mathrm{S}_{11}$ |  | $\mathrm{~S}_{12}$ |  | $\mathrm{~S}_{21}$ |  | $\mathrm{~S}_{22}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Mag. | Ang. | Mag. | Ang. | Mag. | Ang. | Mag. | Ang. |
| 1.4 | 0.659 | $-142.0^{\circ}$ | 0.056 | $34.0^{\circ}$ | 9.549 | $90.3^{\circ}$ | 0.248 | $-96.6^{\circ}$ |
| 3.1 | 0.633 | $155.9^{\circ}$ | 0.099 | $24.3^{\circ}$ | 4.452 | $48.0^{\circ}$ | 0.295 | $147.4^{\circ}$ |

a) Perform the $\mu$-test at both frequencies. ( $\mathbf{1 . 5 p}$ )
b) At which of the two frequencies the transistor has better stability? ( $\mathbf{0 . 5 p}$ )
c) At the frequency determined at $\mathbf{b}$ ) assume the transistor unilateral and compute the maximum transducer power gain (in dB). (1p)
d) Determine the error in the transducer power gain computation induced by the unilateral assumption (in dB). (1p)

A circuit contains an ideal lossless coupler (matched on all ports with infinite isolation) with a coupling factor $\mathrm{C}=5.20 \mathrm{~dB}$ and two matched amplifiers $\mathrm{G}_{1}=9.0 \mathrm{~dB}$ and $\mathrm{G}_{2}=8.3 \mathrm{~dB}$. If the input power is 3.10 mW compute the output power (in mW) (2p)

3. A $50 \Omega$ source is connected to an unknown load resulting an reflection coefficient (as seen by the source) $\Gamma=-0.296+\mathrm{j} \cdot 0.359$.
a) Compute the impedance of the unknown load. (1p)
b) Compute the reflection coefficient seen by the source if we connect to the $50 \Omega$ source two devices identical to the unknown load determined at a) in parallel. (1p)
c) For b) design the match with single-stub matching sections (shunt stub, both solutions). (1.5p)
d) Draw the match schematic. (0.5p)
4. In order to obtain an 15.60 dB gain (minimum) amplifier you must cascade two devices (amplifiers). You have available the four devices in the following table.

| Device | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ |
| :---: | :---: | :---: | :---: | :---: |
| Gain $[\mathrm{dB}]$ | 8.5 | 11.1 | 5.7 | 8.8 |
| Noise Factor $[\mathrm{dB}]$ | 0.95 | 1.25 | 0.54 | 0.79 |

a) Specify any two devices you can use to meet the amplifier requirements. (0.5p)
b) Of all the combinations that meet the requirements, which one has the minimum noise factor? Explain your choice. (1.5p)
5. The scattering parameters of a transistor at two frequencies are as follows:

| $\mathrm{f}[\mathrm{GHz}]$ | $\mathrm{S}_{11}$ |  | $\mathrm{~S}_{12}$ |  | $\mathrm{~S}_{21}$ |  | $\mathrm{~S}_{22}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Mag. | Ang. | Mag. | Ang. | Mag. | Ang. | Mag. | Ang. |
| 2.8 | 0.632 | $163.7^{\circ}$ | 0.092 | $27.5^{\circ}$ | 4.903 | $54.4^{\circ}$ | 0.289 | $156.0^{\circ}$ |
| 0.8 | 0.991 | $-15.0^{\circ}$ | 0.011 | $79.8^{\circ}$ | 6.380 | $164.8^{\circ}$ | 0.541 | $-11.9^{\circ}$ |

a) Perform the $\mu$-test at both frequencies. ( $\mathbf{1 . 5 p}$ )
b) At which of the two frequencies the transistor has better stability? ( $\mathbf{0 . 5 p}$ )
c) At the frequency determined at $\mathbf{b}$ ) assume the transistor unilateral and compute the maximum transducer power gain (in dB). (1p)
d) Determine the error in the transducer power gain computation induced by the unilateral assumption (in dB). (1p)

Note. Except where otherwise specified, assume $50 \Omega$ reference impedance.
Note. Any CAD solution (Matlab, Mathcad, ADS) must be accompanied by the submission of the script/project at the end of the examination.

1. For a normalized impedance equal to $0.945-\mathrm{j} \cdot 1.160$ compute the admittance ( $\mathbf{1 p}$ ) and then plot on a Smith Chart (external circle and complex plane axes) the corresponding point (1p)
2. A circuit contains an ideal lossless coupler (matched on all ports with infinite isolation) with a coupling factor $\mathrm{C}=4.30 \mathrm{~dB}$ and two matched amplifiers $\mathrm{G}_{1}=9.4 \mathrm{~dB}$ and $\mathrm{G}_{2}=8.5 \mathrm{~dB}$. If the input power is 2.90 mW compute the output power (in $\mathbf{~ m W}$ ) ( $\mathbf{2 p}$ )

3. A $50 \Omega$ source is connected to an unknown load resulting an reflection coefficient (as seen by the source) $\Gamma=0.119+\mathrm{j} \cdot 0.398$.
a) Compute the impedance of the unknown load. (1p)
b) Compute the reflection coefficient seen by the source if we connect to the $50 \Omega$ source two devices identical to the unknown load determined at a) in parallel. (1p)
c) For b) design the match with single-stub matching sections (shunt stub, both solutions). (1.5p)
d) Draw the match schematic. (0.5p)
4. In order to obtain an 15.95 dB gain (minimum) amplifier you must cascade two devices (amplifiers). You have available the four devices in the following table.

| Device | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ |
| :---: | :---: | :---: | :---: | :---: |
| Gain $[\mathrm{dB}]$ | 9.3 | 10.9 | 5.6 | 8.5 |
| Noise Factor $[\mathrm{dB}]$ | 0.94 | 1.15 | 0.66 | 0.86 |

a) Specify any two devices you can use to meet the amplifier requirements. (0.5p)
b) Of all the combinations that meet the requirements, which one has the minimum noise factor? Explain your choice. (1.5p)
5. The scattering parameters of a transistor at two frequencies are as follows:

| $\mathrm{f}[\mathrm{GHz}]$ | $\mathrm{S}_{11}$ |  | $\mathrm{~S}_{12}$ |  | $\mathrm{~S}_{21}$ |  | $\mathrm{~S}_{22}$ |  |

Instructor: conf. Radu Damian Student: $\qquad$ Grupa $\qquad$
Note. Except where otherwise specified, assume $50 \Omega$ reference impedance.
Note. Any CAD solution (Matlab, Mathcad, ADS) must be accompanied by the submission of the script/project at the end of the examination.

1. For a normalized impedance equal to $0.810-\mathrm{j} \cdot 0.770$ compute the admittance ( $\mathbf{1 p}$ ) and then plot on a Smith Chart (external circle and complex plane axes) the corresponding point (1p)
2. A circuit contains an ideal lossless coupler (matched on all ports with infinite isolation) with a coupling factor $\mathrm{C}=6.55 \mathrm{~dB}$ and two matched amplifiers $\mathrm{G}_{1}=8.9 \mathrm{~dB}$ and $\mathrm{G}_{2}=9.6 \mathrm{~dB}$. If the input power is 3.75 mW compute the output power (in mW) (2p)

3. A $50 \Omega$ source is connected to an unknown load resulting an reflection coefficient (as seen by the source) $\Gamma=0.099+\mathrm{j} \cdot 0.092$.
a) Compute the impedance of the unknown load. (1p)
b) Compute the reflection coefficient seen by the source if we connect to the $50 \Omega$ source two devices identical to the unknown load determined at a) in parallel. (1p)
c) For b) design the match with single-stub matching sections (shunt stub, both solutions). (1.5p)
d) Draw the match schematic. (0.5p)
4. In order to obtain an 14.30 dB gain (minimum) amplifier you must cascade two devices (amplifiers). You have available the four devices in the following table.

| Device | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ |
| :---: | :---: | :---: | :---: | :---: |
| Gain $[\mathrm{dB}]$ | 8.0 | 10.7 | 5.0 | 7.7 |
| Noise Factor $[\mathrm{dB}]$ | 1.00 | 1.25 | 0.52 | 0.71 |

a) Specify any two devices you can use to meet the amplifier requirements. (0.5p)
b) Of all the combinations that meet the requirements, which one has the minimum noise factor? Explain your choice. (1.5p)
5. The scattering parameters of a transistor at two frequencies are as follows:

| $\mathrm{f}[\mathrm{GHz}]$ | $\mathrm{S}_{11}$ |  | $\mathrm{~S}_{12}$ |  | $\mathrm{~S}_{21}$ |  | $\mathrm{~S}_{22}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Mag. | Ang. | Mag. | Ang. | Mag. | Ang. | Mag. | Ang. |
| 0.2 | 0.927 | $-38.9^{\circ}$ | 0.019 | $71.3^{\circ}$ | 24.719 | $155.1^{\circ}$ | 0.276 | $-51.0^{\circ}$ |
| 3.0 | 0.634 | $158.5^{\circ}$ | 0.096 | $25.5^{\circ}$ | 4.590 | $50.1^{\circ}$ | 0.293 | $150.2^{\circ}$ |

a) Perform the $\mu$-test at both frequencies. ( $\mathbf{1 . 5 p}$ )
b) At which of the two frequencies the transistor has better stability? ( $\mathbf{0 . 5 p}$ )
c) At the frequency determined at $\mathbf{b}$ ) assume the transistor unilateral and compute the maximum transducer power gain (in dB). (1p)
d) Determine the error in the transducer power gain computation induced by the unilateral assumption (in dB). (1p)

# SUBJECT No. 23 <br> Time allowed: 2 hours; All materials/equipments authorized 

Instructor: conf. Radu Damian Student: $\qquad$ Grupa $\qquad$
Note. Except where otherwise specified, assume $50 \Omega$ reference impedance.
Note. Any CAD solution (Matlab, Mathcad, ADS) must be accompanied by the submission of the script/project at the end of the examination.

1. For a normalized impedance equal to $1.195+\mathrm{j} \cdot 0.920$ compute the admittance ( $\mathbf{1 p}$ ) and then plot on a Smith Chart (external circle and complex plane axes) the corresponding point (1p)
2. A circuit contains an ideal lossless coupler (matched on all ports with infinite isolation) with a coupling factor $\mathrm{C}=4.55 \mathrm{~dB}$ and two matched amplifiers $\mathrm{G}_{1}=7.0 \mathrm{~dB}$ and $\mathrm{G}_{2}=11.0 \mathrm{~dB}$. If the input power is 3.15 mW compute the output power (in mW) (2p)

3. A $50 \Omega$ source is connected to an unknown load resulting an reflection coefficient (as seen by the source) $\Gamma=0.334+\mathrm{j} \cdot 0.212$.
a) Compute the impedance of the unknown load. (1p)
b) Compute the reflection coefficient seen by the source if we connect to the $50 \Omega$ source two devices identical to the unknown load determined at a) in parallel. (1p)
c) For b) design the match with single-stub matching sections (shunt stub, both solutions). (1.5p)
d) Draw the match schematic. (0.5p)
4. In order to obtain an 14.65 dB gain (minimum) amplifier you must cascade two devices (amplifiers). You have available the four devices in the following table.

| Device | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ |
| :---: | :---: | :---: | :---: | :---: |
| Gain $[\mathrm{dB}]$ | 8.9 | 11.7 | 5.5 | 8.3 |
| Noise Factor $[\mathrm{dB}]$ | 1.05 | 1.15 | 0.52 | 0.85 |

a) Specify any two devices you can use to meet the amplifier requirements. (0.5p)
b) Of all the combinations that meet the requirements, which one has the minimum noise factor? Explain your choice. (1.5p)
5. The scattering parameters of a transistor at two frequencies are as follows:

| $\mathrm{f}[\mathrm{GHz}]$ | $\mathrm{S}_{11}$ |  | $\mathrm{~S}_{12}$ |  | $\mathrm{~S}_{21}$ |  | $\mathrm{~S}_{22}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Mag. | Ang. | Mag. | Ang. | Mag. | Ang. | Mag. | Ang. |
| 2.1 | 0.640 | $-175.9^{\circ}$ | 0.076 | $34.2^{\circ}$ | 6.341 | $70.2^{\circ}$ | 0.289 | $176.1^{\circ}$ |
| 3.6 | 0.899 | $-63.3^{\circ}$ | 0.043 | $48.4^{\circ}$ | 5.763 | $116.5^{\circ}$ | 0.515 | $-49.0^{\circ}$ |

a) Perform the $\mu^{\prime}$-test at both frequencies. ( $\mathbf{1 . 5 p}$ )
b) At which of the two frequencies the transistor has better stability? ( $\mathbf{0 . 5 p}$ )
c) At the frequency determined at $\mathbf{b}$ ) assume the transistor unilateral and compute the maximum transducer power gain (in dB). (1p)
d) Determine the error in the transducer power gain computation induced by the unilateral assumption (in dB). (1p)

Instructor: conf. Radu Damian Student: $\qquad$ Grupa $\qquad$
Note. Except where otherwise specified, assume $50 \Omega$ reference impedance.
Note. Any CAD solution (Matlab, Mathcad, ADS) must be accompanied by the submission of the script/project at the end of the examination.

1. For a normalized impedance equal to $1.260+\mathrm{j} \cdot 1.295$ compute the admittance ( $\mathbf{1 p}$ ) and then plot on a Smith Chart (external circle and complex plane axes) the corresponding point (1p)
2. A circuit contains an ideal lossless coupler (matched on all ports with infinite isolation) with a coupling factor $C=6.15 \mathrm{~dB}$ and two matched amplifiers $\mathrm{G}_{1}=8.0 \mathrm{~dB}$ and $\mathrm{G}_{2}=11.7 \mathrm{~dB}$. If the input power is 2.85 mW compute the output power (in mW) (2p)

3. A $50 \Omega$ source is connected to an unknown load resulting an reflection coefficient (as seen by the source) $\Gamma=-0.072+\mathrm{j} \cdot 0.459$.
a) Compute the impedance of the unknown load. (1p)
b) Compute the reflection coefficient seen by the source if we connect to the $50 \Omega$ source two devices identical to the unknown load determined at a) in parallel. (1p)
c) For b) design the match with single-stub matching sections (shunt stub, both solutions). (1.5p)
d) Draw the match schematic. (0.5p)
4. In order to obtain an 16.35 dB gain (minimum) amplifier you must cascade two devices (amplifiers). You have available the four devices in the following table.

| Device | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ |
| :---: | :---: | :---: | :---: | :---: |
| Gain $[\mathrm{dB}]$ | 9.9 | 11.1 | 6.4 | 7.6 |
| Noise Factor $[\mathrm{dB}]$ | 0.94 | 1.27 | 0.67 | 0.79 |

a) Specify any two devices you can use to meet the amplifier requirements. (0.5p)
b) Of all the combinations that meet the requirements, which one has the minimum noise factor? Explain your choice. (1.5p)
5. The scattering parameters of a transistor at two frequencies are as follows:

| $\mathrm{f}[\mathrm{GHz}]$ | $\mathrm{S}_{11}$ |  | $\mathrm{~S}_{12}$ |  | $\mathrm{~S}_{21}$ |  | $\mathrm{~S}_{22}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Mag. | Ang. | Mag. | Ang. | Mag. | Ang. | Mag. | Ang. |
| 1.5 | 0.651 | $-146.5^{\circ}$ | 0.057 | $33.3^{\circ}$ | 9.008 | $87.4^{\circ}$ | 0.235 | $-99.5^{\circ}$ |
| 5.0 | 0.821 | $-85.2^{\circ}$ | 0.054 | $34.5^{\circ}$ | 5.345 | $94.1^{\circ}$ | 0.487 | $-64.8^{\circ}$ |

a) Perform the $\mu$-test at both frequencies. ( $\mathbf{1 . 5 p}$ )
b) At which of the two frequencies the transistor has better stability? ( $\mathbf{0 . 5 p}$ )
c) At the frequency determined at $\mathbf{b}$ ) assume the transistor unilateral and compute the maximum transducer power gain (in dB). (1p)
d) Determine the error in the transducer power gain computation induced by the unilateral assumption (in dB). (1p)

1. For a normalized impedance equal to $0.920-\mathrm{j} \cdot 0.915$ compute the admittance ( $\mathbf{1 p}$ ) and then plot on a Smith Chart (external circle and complex plane axes) the corresponding point (1p)
2. A circuit contains an ideal lossless coupler (matched on all ports with infinite isolation) with a coupling factor $\mathrm{C}=4.50 \mathrm{~dB}$ and two matched amplifiers $\mathrm{G}_{1}=8.9 \mathrm{~dB}$ and $\mathrm{G}_{2}=8.9 \mathrm{~dB}$. If the input power is 1.15 mW compute the output power (in mW) (2p)

3. A $50 \Omega$ source is connected to an unknown load resulting an reflection coefficient (as seen by the source) $\Gamma=-0.088+\mathrm{j} \cdot 0.785$.
a) Compute the impedance of the unknown load. (1p)
b) Compute the reflection coefficient seen by the source if we connect to the $50 \Omega$ source two devices identical to the unknown load determined at a) in parallel. (1p)
c) For b) design the match with single-stub matching sections (shunt stub, both solutions). (1.5p)
d) Draw the match schematic. (0.5p)
4. In order to obtain an 16.05 dB gain (minimum) amplifier you must cascade two devices (amplifiers). You have available the four devices in the following table.

| Device | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ |
| :---: | :---: | :---: | :---: | :---: |
| Gain $[\mathrm{dB}]$ | 8.1 | 11.2 | 6.9 | 8.5 |
| Noise Factor $[\mathrm{dB}]$ | 1.02 | 1.20 | 0.53 | 0.77 |

a) Specify any two devices you can use to meet the amplifier requirements. (0.5p)
b) Of all the combinations that meet the requirements, which one has the minimum noise factor? Explain your choice. (1.5p)
5. The scattering parameters of a transistor at two frequencies are as follows:

| $\mathrm{f}[\mathrm{GHz}]$ | $\mathrm{S}_{11}$ |  | $\mathrm{~S}_{12}$ |  | $\mathrm{~S}_{21}$ |  | $\mathrm{~S}_{22}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Mag. | Ang. | Mag. | Ang. | Mag. | Ang. | Mag. | Ang. |
| 2.7 | 0.607 | $172.7^{\circ}$ | 0.075 | $25.1^{\circ}$ | 5.459 | $58.1^{\circ}$ | 0.138 | $-127.6^{\circ}$ |
| 3.3 | 0.912 | $-58.4^{\circ}$ | 0.040 | $51.4^{\circ}$ | 5.839 | $121.5^{\circ}$ | 0.518 | $-45.4^{\circ}$ |

a) Perform the $\mu^{\prime}$-test at both frequencies. ( $\mathbf{1 . 5 p}$ )
b) At which of the two frequencies the transistor has better stability? ( $\mathbf{0 . 5 p}$ )
c) At the frequency determined at $\mathbf{b}$ ) assume the transistor unilateral and compute the maximum transducer power gain (in dB). (1p)
d) Determine the error in the transducer power gain computation induced by the unilateral assumption (in dB). (1p)

c) For b) design the match with single-stub matching sections (shunt stub, both solutions). (1.5p)
d) Draw the match schematic. (0.5p)
4. In order to obtain an 16.45 dB gain (minimum) amplifier you must cascade two devices (amplifiers). You have available the four devices in the following table.

| Device | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ |
| :---: | :---: | :---: | :---: | :---: |
| Gain $[\mathrm{dB}]$ | 8.8 | 10.6 | 6.6 | 8.2 |
| Noise Factor $[\mathrm{dB}]$ | 0.90 | 1.23 | 0.58 | 0.89 |

a) Specify any two devices you can use to meet the amplifier requirements. (0.5p)
b) Of all the combinations that meet the requirements, which one has the minimum noise factor? Explain your choice. (1.5p)
5. The scattering parameters of a transistor at two frequencies are as follows:

| $\mathrm{f}[\mathrm{GHz}]$ | $\mathrm{S}_{11}$ |  | $\mathrm{~S}_{12}$ |  | $\mathrm{~S}_{21}$ |  | $\mathrm{~S}_{22}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Mag. | Ang. | Mag. | Ang. | Mag. | Ang. | Mag. | Ang. |
| 2.6 | 0.634 | $169.4^{\circ}$ | 0.088 | $29.6^{\circ}$ | 5.243 | $58.8^{\circ}$ | 0.287 | $161.4^{\circ}$ |
| 2.9 | 0.927 | $-51.8^{\circ}$ | 0.036 | $55.9^{\circ}$ | 5.938 | $128.1^{\circ}$ | 0.524 | $-40.4^{\circ}$ |

a) Perform the $\mu^{\prime}$-test at both frequencies. ( $\mathbf{1 . 5 p}$ )
b) At which of the two frequencies the transistor has better stability? ( $\mathbf{0 . 5 p}$ )
c) At the frequency determined at $\mathbf{b}$ ) assume the transistor unilateral and compute the maximum transducer power gain (in dB). (1p)
d) Determine the error in the transducer power gain computation induced by the unilateral assumption (in dB). (1p)

Note. Except where otherwise specified, assume $50 \Omega$ reference impedance.
Note. Any CAD solution (Matlab, Mathcad, ADS) must be accompanied by the submission of the script/project at the end of the examination.

1. For a normalized impedance equal to $0.910-\mathrm{j} \cdot 1.295$ compute the admittance ( $\mathbf{1 p}$ ) and then plot on a Smith Chart (external circle and complex plane axes) the corresponding point (1p)
2. A circuit contains an ideal lossless coupler (matched on all ports with infinite isolation) with a coupling factor $\mathrm{C}=5.85 \mathrm{~dB}$ and two matched amplifiers $\mathrm{G}_{1}=7.9 \mathrm{~dB}$ and $\mathrm{G}_{2}=8.3 \mathrm{~dB}$. If the input power is 1.20 mW compute the output power (in mW) (2p)

3. A $50 \Omega$ source is connected to an unknown load resulting an reflection coefficient (as seen by the source) $\Gamma=-0.345+\mathrm{j} \cdot 0.191$.
a) Compute the impedance of the unknown load. (1p)
b) Compute the reflection coefficient seen by the source if we connect to the $50 \Omega$ source two devices identical to the unknown load determined at a) in parallel. (1p)
c) For b) design the match with single-stub matching sections (shunt stub, both solutions). (1.5p)
d) Draw the match schematic. (0.5p)
4. In order to obtain an 16.35 dB gain (minimum) amplifier you must cascade two devices (amplifiers). You have available the four devices in the following table.

| Device | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ |
| :---: | :---: | :---: | :---: | :---: |
| Gain $[\mathrm{dB}]$ | 8.9 | 11.6 | 6.2 | 8.1 |
| Noise Factor $[\mathrm{dB}]$ | 1.01 | 1.25 | 0.64 | 0.70 |

a) Specify any two devices you can use to meet the amplifier requirements. (0.5p)
b) Of all the combinations that meet the requirements, which one has the minimum noise factor? Explain your choice. (1.5p)
5. The scattering parameters of a transistor at two frequencies are as follows:
